

REPUBLIC OF EQUATORIAL GUINEA

National Digital Addressing Platform

SYSTEM ADMINISTRATION

System Administrator Manual

Manual for administering users, login sessions, access, and safe
system controls.

Document control page

Document title:	System Administrator Manual.
Language:	English.
Audience:	System administrators and appointed operators who manage access and safe system controls.
Status:	Controlled pilot training material.
Prepared for:	Equatorial Guinea National Digital Addressing pilot.
Operational support:	BeCore.

Table of contents

- 1.** How to use this manual
- 2.** Audience and responsibilities
- 3.** Training outcomes
- 4.** Key terms
- 5.** Privacy and safety rules
- 6.** Module 1: administrator boundaries
- 7.** Module 2: staff account management
- 8.** Module 3: login sessions
- 9.** Module 4: safe configuration changes
- 10.** Module 5: incident response basics
- 11.** Practice exercises
- 12.** Common mistakes
- 13.** Troubleshooting
- 14.** Assessment checklist
- 15.** Reference index
- 16.** Support and contact

1. How to use this manual

This manual trains the system administrator to manage accounts, login sessions, role access, and operational safety without exposing credentials.

Use the manual in order during a guided session and later as a reference. Each module explains the main task, the correct steps, and the mistakes to avoid.

Examples are for training and do not replace future official instructions.

2. Audience and responsibilities

System administrators and appointed operators who manage access and safe system controls.

1. Perform the assigned role without taking decisions that belong to another role.
2. Use only the data needed for the work.
3. Keep the difference between review, decision, and publication clear.
4. Record observations briefly and verifiably.
5. Escalate uncertainty instead of forcing an action.

3. Training outcomes

By the end of this manual, the participant should be able to:

1. Explain the boundary of the role.
2. Follow the correct daily workflow.
3. Recognize sensitive information.
4. Keep evidence or notes understandable.
5. Know when to escalate a case.

4. Key terms

Official record: information reviewed inside the institutional workflow.

Ready for approval: status showing preparation for authorized decision.

Location evidence: information that helps confirm where a place is located.

Public release lock: control that prevents publication before authorization.

Record history: sequence of actions visible for review and audit.

5. Privacy and safety rules

Do not place passwords, full identity numbers, bank details, or unnecessary private information in notes, examples, or training screenshots.

Basic rules:

1. Use real data only inside the protected system when the role requires it.
2. Use fictional or approved examples in training.
3. Do not share screenshots with private data.
4. Do not copy protected information into public channels.
5. If a situation is sensitive, ask a supervisor.

6. Module 1: administrator boundaries

This module teaches how to understand what administrators can change and what they must protect.

Procedure:

1. Use only assigned administrator accounts.
2. Keep credentials outside manuals and public channels.
3. Change access only for approved users.
4. Record account actions through the system.
5. Avoid direct database edits for normal operations.

Training example: The participant receives a training case related to administrator boundaries. They must follow the steps, explain the reason for each decision, and leave the case ready for the next role without adding unnecessary information.

Mistakes to avoid:

1. Sharing access details outside the approved channel.
2. Leaving old access active after a role changes.
3. Changing more than one control before verifying the result.
4. Recording secret values in notes or screenshots.

7. Module 2: staff account management

This module teaches how to create and maintain staff access safely.

Procedure:

1. Confirm the person and role before creating access.
2. Assign the least required role.
3. Explain sign-in steps without sharing secrets.
4. Disable access when a role ends.
5. Review active accounts regularly.

Training example: The participant receives a training case related to staff account management. They must follow the steps, explain the reason for each decision, and leave the case ready for the next role without adding unnecessary information.

Mistakes to avoid:

1. Sharing access details outside the approved channel.
2. Leaving old access active after a role changes.
3. Changing more than one control before verifying the result.
4. Recording secret values in notes or screenshots.

8. Module 3: login sessions

This module teaches how to handle signed-in sessions when accounts are changed or at risk.

Procedure:

1. Check active sessions when available.
2. Sign a user out everywhere after role change or risk.
3. Do not publish session identifiers.
4. Ask the user to sign in again after reset.
5. Record the action reason.

Training example: The participant receives a training case related to login sessions. They must follow the steps, explain the reason for each decision, and leave the case ready for the next role without adding unnecessary information.

Mistakes to avoid:

1. Sharing access details outside the approved channel.
2. Leaving old access active after a role changes.
3. Changing more than one control before verifying the result.
4. Recording secret values in notes or screenshots.

9. Module 4: safe configuration changes

This module teaches how to make changes without breaking public or staff workflows.

Procedure:

1. Read current readiness before changing settings.
2. Change one control at a time.
3. Verify login and protected pages afterward.
4. Document what changed in operational notes.
5. Escalate risky production changes.

Training example: The participant receives a training case related to safe configuration changes. They must follow the steps, explain the reason for each decision, and leave the case ready for the next role without adding unnecessary information.

Mistakes to avoid:

1. Skipping the role boundary because the case looks simple.
2. Leaving the next action unclear.
3. Adding private details that the next role does not need.
4. Promising an outcome that belongs to another workflow.

10. Module 5: incident response basics

This module teaches how to respond to access issues without leaking secrets.

Procedure:

1. Pause unsafe access.
2. Preserve evidence of the issue.
3. Rotate credentials only through approved channels.
4. Verify old access no longer works.
5. Report the final state plainly.

Training example: The participant receives a training case related to incident response basics. They must follow the steps, explain the reason for each decision, and leave the case ready for the next role without adding unnecessary information.

Mistakes to avoid:

1. Skipping the role boundary because the case looks simple.
2. Leaving the next action unclear.
3. Adding private details that the next role does not need.
4. Promising an outcome that belongs to another workflow.

11. Practice exercises

Exercise 1: Review a training case and state what information is missing.

Exercise 2: Explain which role should act next and why.

Exercise 3: Identify a phrase that could expose sensitive information and rewrite it.

Exercise 4: Prepare a short note that helps the next reviewer.

12. Common mistakes

1. Confuse review progress with final approval.
2. Repeat the same warning in several notes.
3. Leave the case without a clear next action.
4. Use technical language when a simple explanation is enough.
5. Store evidence outside the protected workflow.

13. Troubleshooting

1. If evidence is missing, return the case to the correct role.
2. If status does not match evidence, pause progress and ask for review.
3. If sensitive information appears, remove it from public text and escalate the case.
4. If unsure, do not force a decision; record the question.
5. If the system does not respond, keep the case identifier and contact authorized support.

14. Assessment checklist

1. The participant can explain the role.
2. The participant can complete the main workflow.
3. The participant recognizes sensitive data.
4. The participant keeps notes brief and useful.
5. The participant knows when to escalate.

15. Reference index

1. Authorized support: sections 4, 5, and related modules.
2. Location evidence: sections 4, 5, and related modules.
3. Official record: sections 4, 5, and related modules.
4. Public release lock: sections 4, 5, and related modules.
5. Ready for approval: sections 4, 5, and related modules.
6. Record history: sections 4, 5, and related modules.
7. Sensitive data: sections 4, 5, and related modules.

16. Support and contact

For help during the controlled pilot, contact the operational support team indicated by BeCore or by the institution responsible for the training.

When asking for help, include the case identifier if available, a short description of the problem, and the role you are working from. Do not include passwords or full sensitive data.

If the responsible institution issues an updated rule or procedure, that instruction takes priority.
