

- **National Digital Addressing Platform Architecture**

Government-owned address registry, field operations, approvals, and institutional verification stack

- **Pilot application layer**

- Admin portal for registry, review, and

- **Core platform services**

- Modular monolith keeps early ops simple

- **Operational posture**

- PostgreSQL + PostGIS is the source of truth

reports

- Mobile-first field app for territorial capture
- Scoped lookup surfaces for agencies
- Shared auth and role scoping

- Registry, field workflow, and reporting stay in one codebase first
- Integration API is controlled, not public-by-default
- Background worker handles retries and exports

- Object storage holds field evidence and exports
- Audit, backups, TLS, and monitoring are mandatory
- Start pilot-ready, scale later without rewriting the whole thing

National Digital Addressing Platform • architecture overview for software, operations, and government review
