

Repository Scaffold Overview

Repository Scaffold Overview

This starter repository has been created as a planning scaffold for the national digital addressing platform.

Included directories

```
```text
apps/
 admin-portal/
 field-app/
services/
 api/
 worker/
packages/
 ui/
 config/
 types/
infra/
 docker/
 nginx/
 scripts/
docs/
```
```

Purpose of each area

- `apps/admin-portal` – operational portal for registry admins, ministry reviewers, validators, and helpdesk users
- `apps/field-app` – field capture application for enumerators and supervisors
- `services/api` – main FastAPI backend
- `services/worker` – background jobs for exports, retries, and async processing
- `packages/ui` – shared design tokens and reusable components
- `packages/config` – shared runtime/config utilities
- `packages/types` – shared contracts and generated types
- `infra/docker` – Dockerfiles and compose manifests later
- `infra/nginx` – reverse proxy configuration later
- `infra/scripts` – helper scripts for local/dev/ops tasks later
- `docs` – copied architecture and product documents later

Immediate next coding moves

1. add DB migration tooling
2. scaffold FastAPI service structure
3. scaffold Next.js admin portal shell
4. define shared environment variables
5. connect auth + role model

Why this scaffold matters

It gives the project clean domain separation before implementation starts, so the build does not collapse into one giant cursed folder.
