

REPUBLIC OF EQUATORIAL GUINEA

National Digital Addressing Platform

PUBLIC TRAINING

Public User Guide for Citizens, Residents, and Businesses

User guide for the controlled pilot: submit a location, check an address code, and track a request.

Document control page

Document title:	Public User Guide for Citizens, Residents, and Businesses.
Language:	English.
Audience:	Citizens, residents, businesses, and public users.
Status:	Controlled pilot training material.
Prepared for:	Equatorial Guinea National Digital Addressing pilot.
Operational support:	BeCore.

15. Reference index
16. Support and contact

1. How to use this manual

This manual is a training guide for public users. It can be used in an in-person session, a short training class, or as a reference document.

Read the privacy rules first. Then move through the modules in order. Each module explains what to do, why it matters, the correct steps, and mistakes to avoid.

A submitted location starts a review; public status is explained in section 10.

2. Audience and responsibilities

This manual is for citizens who want to submit a location for review, residents who need to check the status of a request, businesses that need to understand how a location is reviewed, and public-service staff who help other users complete the process.

Primary responsibilities:

1. Write clear and truthful information.
2. Check that the location point is correct before submitting.
3. Avoid unnecessary sensitive data in public fields.
4. Keep the tracking code or reference number.
5. Check public status before assuming that a record is published.

3. Training outcomes

By the end of this manual, the user should be able to:

1. Explain what a location request is.
2. Submit a location with clear information.
3. Understand what GPS accuracy means.
4. Check an address code.
5. Track a request.
6. Distinguish between a submitted location, a case under review, and a published record.
7. Know where to get help when a request does not move forward.

4. Key terms

Location request: information submitted by a user so a location can be reviewed.

Submitted location: a request that has been sent to the system and is waiting for review.

Address code: a public code used to identify or check a location.

GPS accuracy: an estimate of how close the captured point is to the real location.

Location evidence: information that helps confirm where the place is located.

Official record: a reviewed record inside the official registry workflow.

Ready for approval: the case is prepared for authorized review.

Public status: shows whether a record is not public, held internally, or published.

Public release lock: a control that prevents publication before authorization.

5. Privacy and safety rules

Important: do not write full identity-document numbers, passwords, bank details, medical information, or unnecessary sensitive data in public request fields.

Basic rules:

1. Use only the information needed to identify the location.
2. Do not share the tracking link with people who should not see it.
3. Review information before submitting.
4. Do not use a location request for complaints unrelated to addressing.
5. If a location involves sensitive information, ask an authorized operator for guidance.

6. Module 1: public service overview

This module explains the purpose of the public service.

The system helps record, review, and check locations in an organized way. Its purpose is to support public services, delivery, planning, citizen service, and address verification.

A public user can:

1. Submit a location request.
2. Check an address code.
3. Track a request.
4. Report a public correction when visible information needs review.

A public user cannot:

1. Approve official records.
2. Publish final addresses.
3. Issue official certificates.
4. Create physical signage.
5. View sensitive internal review data.

The public user starts or checks the process; institutional decision status is explained in section 10.

7. Module 2: submit a location request

This module teaches how to submit a location for review.

Procedure:

1. Open the public page for registering a location.
2. Read the controlled-pilot notice.
3. Select or confirm the correct province.
4. Allow GPS capture if it is available and safe to use.
5. Check the point shown on the map.
6. If the point is not correct, correct the location manually according to the page instructions.
7. Write a clear description of the place.
8. Add a simple reference, such as a nearby building, road, neighborhood, or known landmark.
9. Review the GPS accuracy if it appears on the screen.
10. Submit the request only when the information is correct.
11. Save the code or tracking number.

Training example: a person wants to register the main entrance of a small shop. The user places the point on the entrance, writes the business name, adds a nearby reference, and submits the request. The system stores the information as a submitted location for review.

Mistakes to avoid:

1. Skipping the role boundary because the case looks simple.
2. Leaving the next action unclear.
3. Adding private details that the next role does not need.
4. Promising an outcome that belongs to another workflow.

8. Module 3: check an address code

This module teaches how to check whether an address code has public information available.

Procedure:

1. Open the public address check or public proof page.
2. Type the code exactly as it appears.
3. Check whether the system recognizes the code.
4. Read the public status shown.
5. If public information is available, confirm that it matches the expected place.
6. If the code does not appear or is not public, do not assume it is invalid; it may be pending review or held internally.

How to read the result:

1. Code recognized: the code format can be checked.
2. Public information available: approved public information exists for public viewing.
3. Not public yet: the case may be pending, held internally, or not approved for publication.
4. Not found: check whether the code was typed correctly.

Important: a recognized code does not always mean public information exists.

9. Module 4: track a request

This module teaches how to review the status of a request after submitting it.

Procedure:

1. Open the public tracking page.
2. Type the tracking number or code received after submission.
3. Read the status shown.
4. Check whether the system asks for more information or shows that the request is under review.
5. If the status does not change after a reasonable time, use section 16.

Common statuses:

1. Submitted: the request was received.
2. Under review: an authorized operator or team is reviewing the information.
3. Needs field check: the location needs additional review by field staff.
4. Ready for approval: the case is prepared for authorized decision.
5. Published: approved public information is available.
6. Rejected or closed: the request did not move forward; review the explanation if one is available.

10. Module 5: understand public status

This module explains why some requests do not appear as public information immediately.

Main ideas:

1. A submitted location is a request, not a final publication.
2. Internal review checks quality, duplicates, and evidence.
3. The public release lock protects information until authorized decision.
4. Signage, certificates, and official exports are handled after that decision.

Difference between stages:

1. Submitted location: the user submitted the information.
2. Internal review: operators review quality, duplicates, and location evidence.
3. Ready for approval: the case can move to authorized decision.
4. Published official record: approved information is available for public viewing.

11. Practice exercises

Exercise 1: prepare a location request.

Goal: practice gathering information before submitting.

Scenario: a family wants to submit the location of their home.

Steps:

1. Write a clear description of the place.
2. Identify a nearby reference.
3. Explain what information should not be written in public notes.
4. Review what GPS accuracy means.

Expected result: the participant can prepare a clear and safe request.

Exercise 2: check a code.

Goal: practice reading a check result.

Scenario: a business receives an address code and wants to check it.

Steps:

1. Type the code on the check page.
2. Read the public status.
3. Explain whether the code is published or may still be pending.
4. State what to do if it does not appear.

Expected result: the participant does not confuse code recognition with final official publication.

Exercise 3: responsible tracking.

Goal: practice tracking safely.

Scenario: a person wants to ask about the status of their request.

Steps:

1. Use the tracking number.
2. Read the status.
3. Prepare a short question if help is needed.
4. Avoid repeating full details that are not needed.

Expected result: the participant knows how to ask for help safely.

12. Common mistakes

1. Submitting the point without checking the map. This can place the record in the wrong location. The correct approach is to confirm the point before submitting.
2. Writing vague notes. This makes review harder. The correct approach is to use clear and verifiable references.
3. Including full sensitive data. This increases exposure risk. The correct approach is to use only necessary information.
4. Thinking the request is already official. This confuses the public process. The correct approach is to check the status.
5. Sharing tracking details without control. This may expose request information. The correct approach is to share only with authorized people.

13. Troubleshooting

1. If GPS does not work, try again in an open area or use manual correction if available.
2. If the point appears far from the real place, move the point manually before submitting.
3. If the code is not recognized, check letters, numbers, and hyphens.
4. If the request does not appear, confirm the tracking number and try again.
5. If the status does not change, use section 16 with the tracking number.
6. If public information appears incorrect, use the public correction workflow if it is available.

14. Assessment checklist

The participant can:

1. Explain what a location request is.
2. Submit a request with a clear description.
3. Check a map point before submitting.
4. Explain GPS accuracy in simple words.
5. Check an address code.
6. Track a request.
7. Distinguish between submitted, internal review, and published.
8. Avoid placing full sensitive data in public notes.
9. Know where to get help when a request does not move forward.

15. Reference index

- 1.** Address code: sections 4 and 8.
- 2.** Field check: sections 9 and 10.
- 3.** GPS accuracy: sections 4, 7, 11, and 13.
- 4.** Location evidence: sections 4, 7, and 10.
- 5.** Location request: sections 2, 3, 4, and 7.
- 6.** Official record: sections 4 and 10.
- 7.** Public release lock: sections 5 and 10.
- 8.** Public status: sections 8, 9, and 10.
- 9.** Ready for approval: sections 4, 9, and 10.
- 10.** Submitted location: sections 4, 9, and 10.
- 11.** Table of contents: start of manual.
- 12.** Tracking: sections 9, 11, and 13.

16. Support and contact

For help during the controlled pilot, contact the operational support team indicated by BeCore or by the institution responsible for the training.

When asking for help, include the tracking number or code if available, a short description of the problem, a screenshot or explanation of the message seen without passwords or full sensitive data, and the province or general area related to the request.

This manual does not replace future official instructions. If the responsible institution issues an updated rule or procedure, that rule takes priority.
