Submission of the National Digital Addressing System proposal for Equatorial Guinea.

To the competent authorities of the Republic of Equatorial Guinea:

BeCoreOps Equatorial Guinea respectfully submits this proposal for consideration as technical and operational support to a government-owned national address registry, geospatial service layer, citizen digital address service, field-capture model, and phased rollout structure.

This is national infrastructure, not a narrow software product. The purpose is to help the State define standards correctly, prove value through a disciplined pilot, and build the institutional and operational foundations required for trusted nationwide expansion.

BeCoreOps is indigenous Equatoguinean-led. That is a point of pride and a practical security advantage: sensitive location infrastructure should be understood, governed, and operated close to national authority.

Respectfully submitted,

BeCoreOps Equatorial Guinea
