

Not a map project — a national address operating layer

The recommended programme is a phased National Digital Addressing System, led by government and supported by BeCoreOps, designed to become the authoritative source of location identity across Equatorial Guinea.

For citizens

- Know, search, and share a clear official address.
- Receive deliveries, utility visits, and emergency response more reliably.
- Verify, print, and request correction through a controlled public channel.

For ministries and municipalities

- Maintain one trusted registry instead of fragmented local lists.
- Track coverage, verification, gaps, and field progress.
- Connect addressing to permits, taxation, census, land, and services.

For logistics and utilities

- Reduce failed deliveries and service visits.
- Plan routes, zones, and dispatch with verified coordinates.
- Integrate approved address APIs over time.

For national leadership

- Create measurable visibility into territorial coverage.
- Support planning, infrastructure decisions, and readiness.
- Strengthen digital sovereignty through a government-owned registry.

Core proposal: approve a 9-month pilot covering standards, field capture, registry build, citizen digital address service, and public-service integration in priority zones, then scale into a 3-year phased national rollout.
