

Citizen Digital Address Layer

The citizen layer should work like a simple national public utility: every person, business, institution, and service point can search, share, verify, and correct an official digital address.

Citizen actions

- Search by address code, name, landmark, road, building, or map area.
- Share a short official address code for delivery, forms, services, and emergency location.
- Print or download proof-of-address extract when the record is published.
- Report incorrect names, coordinates, duplicates, or missing buildings.

GhanaPostGPS-style pattern, localized

- Simple public digital address, not an office-only registry.
- Map-first retrieval where maps are available; code-first use where connectivity is limited.
- Government-owned registry and national code grammar, not a private black box.
- Bilingual public guidance and print-safe extracts.

Citizen / business / institution

Search or map lookup → official digital address code → verification/extract/share link

Correction request enters controlled government review, not direct public editing.
