

## SYSTEM COMPONENTS

# Platform Model

The national system should combine a registry, map layer, field workflow, address code engine, citizen access, operations dashboard, and controlled integrations.

| Layer                     | Capability                                                             | National value                        |
|---------------------------|------------------------------------------------------------------------|---------------------------------------|
| National address registry | Authoritative roads, buildings, service points and verification state. | Single source of truth.               |
| Geospatial map layer      | Roads, districts, buildings, landmarks, and service points.            | Usable in field and planning offices. |
| Field capture app         | Mobile/tablet capture of buildings, photos, coordinates and evidence.  | Structured rollout and QA.            |
| Address code engine       | Official formats, short codes, labels, signage references.             | Consistency across institutions.      |
| Citizen and agency access | Search, verify, correct, print proof, and approved API access.         | Real adoption beyond the registry.    |
