

Governance, Security and Architecture

This must be run as national trust infrastructure: government-owned registry, clear authority, verified publication, auditability, and controlled integrations.

Governance

- Government ownership of standards and source of truth.
- Cross-ministry steering: transport, local administration, planning, land, postal, telecom, emergency and municipalities.
- Verification before publication.

Security

- Role-based access, request IDs, structured logs and backups.
- Sensitive location data must not drift into contractor silos.
- Local capability reduces unnecessary exposure and dependency.

Citizen/public portal: search, verify, extract, correction request

Operator portal: field review, registry, publication, reporting

API service: auth, registry, publication, reporting, public services

Data layer: address registry, geospatial records, audit logs, backups

Approved integrations: postal, emergency, utilities, planning, tax, logistics
